TITLE: An antiphage, antitumor substance extracted from *Actinomyces globisporus* which specifically reacts with DNA

SOURCE: AN SSSR. Doklady, v. 170, no. 4, 1966, 970-973

TOPIC TAGS: fungus, DNA, bacteriophage, neoplasm, amino acid

ABSTRACT: The antiphage action of a substance present in cultures of *Actinomyces globisporus* (strain 81) on various organic media was studied using special sensitive actinophage strains. This antiphage action is removed by high-molecular-weight DNA of the thymus or DNA from other sources (calf pancreas and herring sperm in these experiments), but low-molecular-weight products of enzymatic or acid hydrolysis of DNA of the thymus, RNA, and albumin do not neutralize the antiphage activity of strain 81. A water-soluble powder extracted from

2
Actinomyces globisporus culture fluid was active against gram-positive bacteria (*Staphylococcus aureus* 209, *Bacillus subtilis*, *Bacillus mycoides*, and *Sarcina lutea*), but was inactive with respect to gram-negative bacteria, yeasts, and fungi. It has been demonstrated that preparation 81 retards the growth of some transplanted animal tumors, such as Ehrlich ascites tumors, and cultures of human cancer cells. Analysis of preparation 81 shows the presence of amino acids and the sugars xylose, arabinose, and glucose, suggesting that the substance is a glucoprotein. Orig. art. has: 3 figures and 1 table. AUTHORS: Kuindzhi, D.M., Igonin, L.A., Gribova, Z.P., and
Shabadash, A.N.

TITLE: Photochromism and electron paramagnetic resonance
of α -(o,p-dinitrobenzyl)-pyridine (I)

PERIODICAL: Optika i spektroskopiya, v.12, no.2, 1962, 220-223

TEXT: The authors discuss the mechanism of tautomeric
radical conversions taking place in α -(o,p-dinitrobenzyl)-
pyridine (I), caused by the exposure to light. (I) was prepared
from α -(benzyl)-pyridine and recrystallized repeatedly from
alcohol. The melting points of the yellow and violet forms were
both the same (93 °C). I-N-CH₃- α -(o,p-dinitrobenzyl)-pyridine
and N-CH₃- α -(o,p-dinitrobenzyl)-pyridine were also prepared, but
neither of them showed any phototropic or paramagnetic properties.
The e.p.r. spectrum was studied in a spectrometer with double
modulation of the magnetic field and with synchronous detection
and registration in the form of the first derivative.
Arrangements were made to heat the sample directly in the
resonator. The illumination was by unfiltered Hg-in-quartz lamp.
Card 1/2

Photochromism and electron ...

S/051/62/012/002/006/020
E202/E192

The concentration of paramagnetic particles in (I) after two hours illumination was 10^6 , and the e.p.r. signal of the same had a width of about 50 oerst. showing a non-symmetric doublet with a g-factor equal approximately to that of a free electron. The change in the e.p.r. signal after illumination indicated the presence of two free radicals. This was further confirmed by the formation of the peroxy-radicals. It was concluded that the reversible change in colour and the appearance of paramagnetism in (I) was dependent on the tautomeric radical changes caused by exposure to ultraviolet radiation. There are 2 figures.

SUBJECT: USSR/Fuel, Oil Shale

AUTHORS: Gubergrits, M.Ya, Candidate of Technical Sciences, and Kuiv, K.A.

TITLE: Investigation of the Dynamics of Kukersite-Oil Shale Heating with One-Sided Heat Supply (Izucheniye dinamiki nagreva slantse-kukersita pri odnostoronnem podvode tepla)

PERIODICAL: Izvestiya Akademii Nauk Estonskoy SSR, Seriya Tekhnicheskikh i Fiziko-Matematicheskikh Nauk, 1957, # 3, pp 219-228 (USSR).

ABSTRACT: The process of oil shale thermal treatment is closely connected with time-changes of temperature field characteristics, both in a single piece and in some section of lump (or granular) material. The present article describes and discusses results of an experimental investigation of the dynamics of a thermal field changing in a lump and in a layer of granular oil shale under condition of linear propagation of the thermal flux. In practice, the problem is reduced to the reproduction of temperature field changes in a semi-bounded rod with one-sided heat supply. The thermal flux propagates along the normal to the isothermal heating surface.
